

Thank you for the opportunity to attend the P&G Symposium. This mentorship opportunity was an amazing experience. The small group setting allowed for dialogue, learning, and camaraderie. I appreciate P&G's time and willingness to share information. The research and science behind skin and hair care are truly amazing! I feel as though hair care information is severely lacking in the specialty of dermatology. Learning the development and testing of hair care formulations was enlightening.

The amount of information gathered by P&G is vast, ranging from genetics influencing beauty to the sound of hair being washed. This information contributes not only to the quality of their products, but also to our scientific knowledge in medicine. P&G has partnered with 23 and Me to gain access to millions of peoples DNA. Through mapping of genes known to influence skin and aging, they are learning how specific gene expression varies throughout the aging process. This is pioneering the way for future therapy targets. I am excited about the potential of this research and look forward to learning more from P&G!

Thanks again,
Frankie Rholdon, MD
